EXPERIMENT 15

Detect corners in the image using the Harris Corner Detection function.

Aim

Detect corners in the image using the Harris Corner Detection function.

Algorithm

• Import OpenCV and NumPy.

• Read the input image.

• Convert it to grayscale and floating-point format.

• Apply the Harris corner detector.

• Mark and save detected corners.

Code

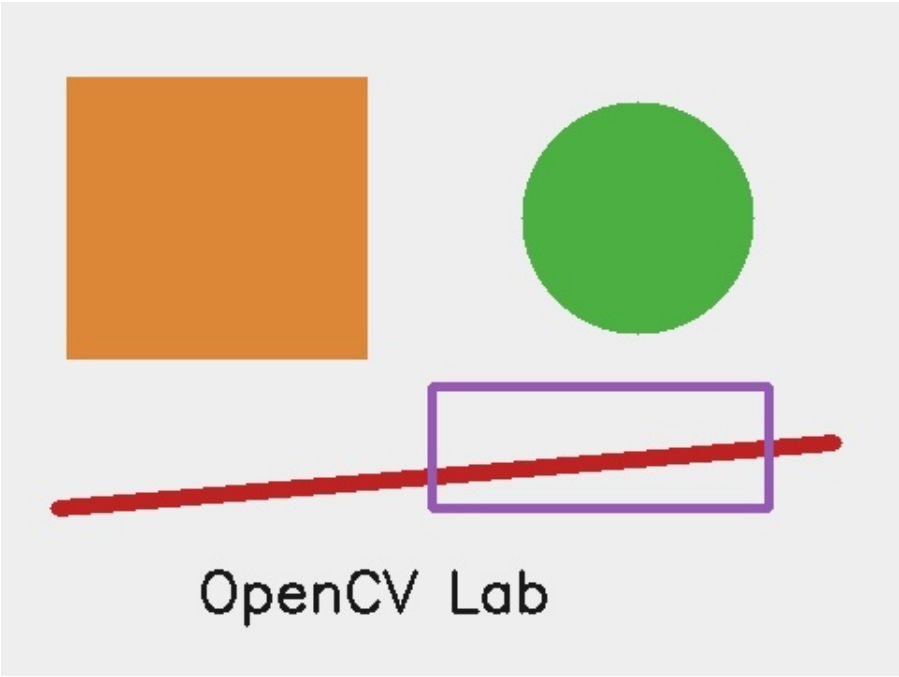

```
import cv2
import numpy as np

img = cv2.imread("images/input.jpg")
if img is None:
    raise FileNotFoundError("images/input.jpg not found")
gray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)
corners = cv2.cornerHarris(np.float32(gray), 2, 3, 0.04)
result = img.copy()
result[corners &gt; 0.01 * corners.max()] = [0, 0, 255]
cv2.imwrite("output_images/experiment15_harris_corners.png", result)
print("Saved output_images/experiment15_harris_corners.png")
```
